

SePem® 300 | Noise logger for the stationary monitoring of water pipe networks

SePem® 300

for stationary / continuous use

Detect leaks in your water pipe network by remote surveillance. The measurement data gathered can be sent securely and conveniently by roaming wherever there is a mobile phone network*.

The advantages

- Flexible programming of measurements and data transmission – can be optimally adapted to local conditions and different types of network.
- No extra data costs – the logger already holds the volume of data ordered (flat rate).
- Ready to go – no need to insert a SIM card.
- Consistently optimal network connection – the logger always uses the strongest mobile phone network at the installation location.
- Measurement data sent directly to a PC or server – no time wasted patrolling the measurement locations or retrieving measurement data.
- Saves costs by reducing the duration of leaks – leaks are detected very soon after they occur.
- Excellent availability – potential battery life in excess of four years (depending on selected settings).
- Clear results – map-based software for data visualisation.

The software

- Always reliably informed – the clear display of measuring points shows the current network situation at all times.
- All information at a glance – details of every measurement location shown for the active position.
- Extensive possibilities – not only is there a clear view of the measuring points, there is also a wide range of additional functions available. These include planning aids for selecting measuring points as well as display options and the integration of photos of the installation environment.
